FSL Farewell

- **FSL was there from the start - STS 122 1E Mission to the ISS 2008**

Meanwhile, Peggy was working on a special assignment. Since she was not trained as an FSL expert, she had not been scheduled to work on FSL. Now, however, there was work to be done on it – and Peggy had the time. Twenty minutes were immediately scheduled for Peggy during which she could familiarise herself with the functions of FSL and think over the related procedures; then she stepped into the breach to help on this rack. Her first task was to connect FSL to the Columbus module with cables and leads, the first rack to be connected this way. Until now, all the experiment racks had been installed, but not yet connected via the umbilicals to the resources of the research laboratory.

Thank you!
